

Gymnastic Club - Eastern USA

Real-time energy monitoring of one of the gyms at the Girls and Boys Club revealed unusually high consumption in the evenings.

This anomaly had gone unnoticed without Eniscope, but armed with real-time data, one of the Directors decided to investigate.

It was determined that the excess consumption was coming from electric heaters. It seems the Club's Volunteers had been altering the thermostats resulting in permanent heating of the gym...even at night! The thermostats were subsequently locked down and energy expenditure plummeted from \$10,000 per month to \$6000 per month - an annualized saving of \$48,000!
